

Amendments to the Specification

Page 10, beginning with line 2, amend the abstract as follows.

~~In the case of a~~ A chair, ~~in particular~~ such as a swivel chair for the office, ~~the~~ has an armrest that is made up of an armrest carrier, which ~~comprises~~ includes a carrier (1) and a sleeve (2) sliding thereon and is attached to the seat at the bottom by a seat flange (3) which can be displaced transversely to the seat direction, and of an arm support (~~10, 11~~), which can be displaced longitudinally via a guide (7) and can be rotated via a rotary part (4) mounted in a rotary bearing (5). The guide (7) is arranged parallel, but eccentrically in relation, to the axis of symmetry of the arm support. Since the rotatability of the arm support is at least 180°, it is possible to set different clear distances between the two arm supports (~~10, 11~~) of the chair.
